

1.List all the main components you find inside a desktop PC after opening the cabinet, and write a short description (1-2 lines) for each.

Ans.

Component	Description
Motherboard	This is the main board that connects all the parts together
CPU	This is the brain of the computer that do all the tasks and instructions
RAM	Store the temporarily memory to run the programs faster
Hard disk drive (HDD)	This can store the operating system, software, and files permanently
Switch More Power Supply (SMPS)	It can give the power to all the components of the computer
Cables	It can connect the different parts of the computer and also supply the power and transfer data.
Cooling Fan	It can keeps the computer cool by moving hot air out.

2.Take clear photos or draw labeled diagrams of each step as you disassemble a desktop PC, and organize them in a document with captions explaining what you did at each step. Include steps like unplugging power, removing side panel, disconnecting cables, and removing RAM, HDD/SSD, and motherboard.

Ans.

3.Reassemble the PC you disassembled, documenting each step with a brief explanation of what you connected or installed and why the order matters.

Ans.

step	What I did	Why it is important
Installed the Motherboard	I placed the motherboard inside the cabinet and fix with them screws	It is the main part where all other parts are connected
Installed the CPU and Fan	I placed the CPU in the CPU socket and the attached the cooling fan	The fan can cools the CPU when they running
Installed the RAM	I install the RAM into there socket until them lock	RAM can helps the computer to run the programs
Installed the HDD/SSD	I put the HDD/SSD on there place and fix it	They store the Windows, software, and files
Connected the Cables	I can connected the power and data cables to all the parts	The cables give them power and connect them together
Installed the Graphic card	I placed the graphic card in there slot and fixed them with the screws	It can helps to show the pictures, video and game into the screen

Closed the Cabinet	I put the side panel back and fixed them with screws	They can keeps them safe from the dust and damage
Turned On the PC	Then connect them with the power cables and switched on the computer	This can check the all the parts are working properly

4.Create a checklist of safety precautions and tools needed before starting the PC assembly/disassembly process, and explain why each is important.

Ans. ► Safety Precautions

Turn off the PC and unplug the power cable

Why: Prevents electric shock and protects the components.

Press the power button for a few seconds after unplugging

Why: Removes any remaining electricity inside the PC.

Work on a clean and flat surface

Why: Keeps the components safe and prevents them from falling.

Avoid touching the gold connectors or chips

Why: Helps prevent damage from static electricity or fingerprints.

Keep screws in a small container

Why: Prevents screws from getting lost during the process.

► **Tools Needed**

Screwdriver

Why: Used to remove and tighten screws inside the PC.

Anti-Static Wrist Strap (Optional)

Why: Protects sensitive computer parts from static electricity.

Small Container for Screws

Why: Keeps all screws organized and easy to find.

Soft Brush or Compressed Air

Why: Removes dust from fans and other components safely.

Flashlight (Optional)

Why: Helps you see small connectors and screws inside the cabinet.
